

*My Calculating g/kg Ethanol Intake from Grams of 20% EtOH Consumed

CORRECT WAY TO CALCULATE INTAKE (G/KG)

- **ORIGINAL EQUATION:**

- $I(\text{g/kg}) = (\text{Vc} \times \text{De}) / \text{MW}(\text{in kg})$

- Intake = volume consumed(Vc) X density of ethanol(De) , divided by mouse weight(MW) (in kg)
 - Density of ethanol=0.789 g/ml

- **Must first calculate Vc:**

- $\text{Vc} = (\text{Wi} - \text{Wf} [-\text{Waste}]) \times \text{D20e}$
 - volume consumed = initial bottle weight - final weight -waste weight [if including in your eqn] * density of 20% ethanol
 - Density of 20% ethanol = 0.97336 g/ml
 - Vc is NOT the same value used in the Intake equation!
 - **Vce = volume consumed of ethanol (alone) = Vc X 0.2 (since 20% ethanol)**

- **CORRECTED EQUATION :**

- $I(\text{g/kg}) = (\text{Vce} \times \text{De}) / \text{MW}$

- $\text{Vce} = (\text{Wi} - \text{Wf} [-\text{Waste}]) \times \text{D20e} \times 0.2$
